

# Non responsive

## Scenario Overview:

I walk outside my place of work to find someone has collapsed and not responding, there is a crowd starting to form around the casualty. I am unaware of how long they have been unconscious. Later they suddenly start breathing.

## Difficulty:

First Aider Easy

## How the scenario should progress:

Casualty is found unconscious and breathing while later on during the scenario they are unconscious not breathing ( UNB). The First Aider, which is me, is to move all bystanders away.

## Actor Tips:

## Patient 1:

**Name:** Elias Rivas **Age:** 18 **Sex:** Male

## Medication:

none

## Allergies:

Allergic to peanuts

## Past medical/family/social history:

None Known

## Findings on examination:

Found the unconscious casualty breathing, their breathing is shallow, and they have a faint pulse.

## Possible treatment from first aiders:

As a first aider I would check vitals and administer CPR if necessary. If the patient is stable and there is no apparent spinal injury I would turn them onto their side and carefully monitor them until medical aids have arrived.
